DEVELOPMENT SCOPE DOCUMENT

Fairway CRM

End-to-End Build Specification — Companies, Facilities & Sales Pipeline

Module: CRM (Customer Relationship Management)

Parent Project: Fairway AI — Detailed Project Solution Blueprint

Prepared for: Development Team / Co-developer Handoff

Recommended Stack: FastAPI + PostgreSQL (Backend), Modular Monolith Architecture

Document Status: Ready for Development

Date: August 2026

Table of Contents

01 Company / Lead Management

02 Facility Management

03 CRM Pipeline (Kanban)

04 Company Detail Page

05 Notes

06 Follow-up / Tasks

07 Contacts

08 Activity Timeline

09 Search & Filters

10 CRM Dashboard

11 Map ↔ CRM Integration

12 User Roles & Permissions

13 Database Schema (Initial)

14 Backend APIs

15 Frontend Pages

16 Out of Scope (Phase 2+)

17 Suggested Developer Split

> **Note:** This document extends the existing *Fairway AI Detailed Project Solution Blueprint*. Items marked **Recommended Addition** are not explicitly defined in the original blueprint but are standard CRM requirements added for completeness. Everything else builds directly on top of the blueprint's company/facility foundation and map integration.

01 Company / Lead Management

Every company (lead / account) in the system is the top-level CRM record. Facilities, contacts, notes, activities and tasks all hang off this record.

Company Fields

- Company ID
- Company name
- Legal name
- Website
- Industry
- Company status
- Address
- City
- Pincode
- Phone
- Email
- Assigned salesperson / owner
- Prospect stage
- Priority
- Created date
- Updated date

> **Design rule:** Company records must remain separate from facility records. A single company can own multiple plants, offices, or warehouses — each with its own location and status. This is a blueprint requirement, not optional.

02 Facility Management

A company can have **multiple facilities**. The platform's map is built around physical facilities — not companies — so this table is central to the map view, not just a sub-record of the company.

Facility Fields

- Facility ID
- Company ID (FK)
- Facility name / type
- Address
- Latitude
- Longitude
- Facility status
- Contact information (if available)
- Created date
- Last updated
- Link back to company

> **Why this matters:** The map plots facilities as pins, not companies. Every facility must carry its own lat/long and status so it can be rendered independently while still rolling up to its parent company.

03 CRM Pipeline (Kanban)

A Kanban-style pipeline drives the sales workflow. Stages should be configurable, not hardcoded.

```
New → Contacted → Qualified → Proposal → Negotiation → Won → Lost
```

Pipeline Fields (per company)

- Current stage
- Stage changed date
- Assigned owner
- Priority
- Expected value (optional)
- Lost reason
- Next follow-up date

Stages are stored in a dedicated `crm_stages` table so an Admin can reorder, rename, add, or retire stages without a code change.

04 Company Detail Page

Clicking a company opens a single detail view composed of the following blocks:

4.1 Company Header

- Company name
- Industry
- Status
- Owner
- Prospect stage
- Priority

4.2 Contact Information

- Phone
- Email
- Website
- Address

4.3 Facilities

- List of all facilities
- Facility location
- Facility status

4.4 CRM Activity

- Notes
- Calls
- Meetings
- Follow-ups
- Stage changes

4.5 Tasks

- Next follow-up
- Assigned person
- Due date
- Task status

4.6 History

- Who changed what
- When it was changed

> This layout matches the blueprint's expectation that the company/facility detail view contains notes, actions, and history — not just static fields.

05 Notes

Simple internal notes attached to a company, visible only to authorized CRM users.

```
Company
   ↓
Notes
   ├─ Note text
   ├─ Created by
   ├─ Created at
   └─ Updated at
```

Example: *“Spoke with warehouse manager. Interested in 20,000 sq ft requirement.”*

Notes are private to authorized CRM users — enforce this at the API layer, not just in the UI.

06 Follow-up / Tasks Recommended Addition

The blueprint only mentions basic follow-up context — a full task object is recommended so follow-ups can be tracked, assigned, and closed out properly.

Task Fields

- Task ID
- Company ID
- Facility ID (optional)
- Assigned user
- Task type — Call / Meeting / Email / Follow-up / Other
- Description
- Due date
- Priority
- Status — Pending / Completed / Cancelled

Dashboard — Today's Follow-ups

Company	Task	Owner	Due
ABC Ltd	Call	User 1	Today
XYZ Pvt Ltd	Meeting	User 2	Tomorrow

07 Contacts Recommended Addition

A real CRM cannot store a single phone/email against a company — multiple people at each company need to be tracked individually.

```
Contact
---------
id
company_id
name
designation
department
phone
email
linkedin_url
is_primary
notes
created_at
updated_at
```

Example:

```
ABC Industries
│
├─ Rahul Shah — Plant Manager
├─ Amit Patel — Purchase Manager
└─ Neha Mehta — Operations Head
```

08 Activity Timeline

Every interaction with a company should appear in a single chronological feed — this is what makes the CRM useful day-to-day, rather than just a static company database.

```
23 Aug   [CALL]    Called Rahul Shah
                   "Discussed warehouse requirement"

21 Aug   [NOTE]    Note added
                   "Company expanding production"

18 Aug   [EMAIL]   Email sent

15 Aug   [STAGE]   Stage changed
                   Contacted → Qualified
```

Database Table

```
activities
----------
id
company_id
contact_id
user_id
activity_type
description
activity_date
created_at
```

09 Search & Filters

Search

- Company name
- Contact name
- Phone
- Email
- City

Filters

- Industry
- Prospect stage
- Owner
- Priority
- Status
- Facility type
- Created date
- Last activity
- Next follow-up

The blueprint already specifies company/facility search and filters for name, industry, city, area, pincode, status, score, and dates — this section extends that with CRM-specific filters (owner, stage, priority, follow-up).

10 CRM Dashboard

Important: This is the sales/operations dashboard — keep it separate from the AI/data dashboard.

Summary Cards

1,245	86	54	32	12	8
TOTAL COMPANIES	NEW LEADS	CONTACTED	QUALIFIED	NEGOTIATION	WON

Dashboard Sections

- Pipeline chart
- My leads
- Today's follow-ups
- Overdue follow-ups
- Recently contacted
- Recently added companies
- Recent activities

11 Map ↔ CRM Integration

This integration is particularly important for Fairway — the map and CRM must feel like one product, not two separate tools.

From the Map

Click company marker → Open CRM profile

From the CRM

Company → View on Map

```
Map
 ↓
Company Marker
 ↓
Company Detail
 ↓
Open CRM
 ↓
Assign Owner / Change Stage / Add Note / Add Follow-up
```

This flow is already defined in the blueprint (map → company/facility detail); this section makes the CRM the natural next step after that flow, not a separate module.

12 User Roles & Permissions

Role	Permissions
Admin	Manage users · Manage companies · Assign leads · Edit everything · View all CRM data
Sales / Analyst	View companies · Add notes · Change stage · Create activities · Manage assigned leads
Viewer	View companies · Cannot modify CRM data

Matches the blueprint's Admin / Analyst / Viewer model. Permissions must be enforced on the backend (API layer), not just hidden in the UI.

13 Database Schema (Initial)

Hand this list of tables to the co-developer as the starting schema:

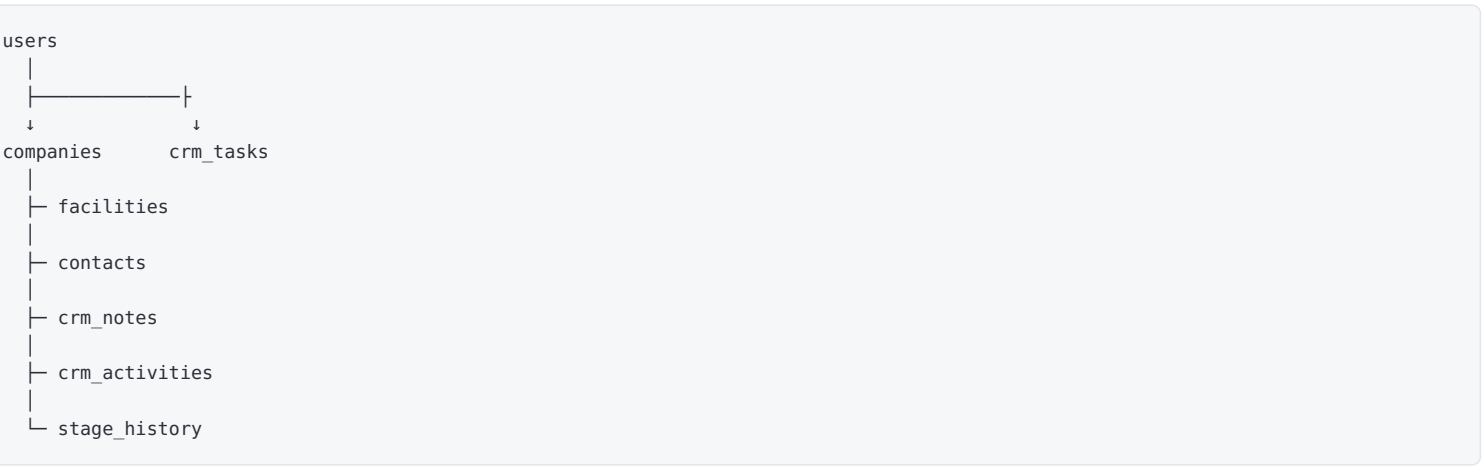

```
users
companies
facilities
contacts

crm_leads
crm_stages
crm_activities
crm_notes
crm_tasks

company_assignments
company_stage_history

notifications
audit_logs
```

Key Relationships

14 Backend APIs

Recommended stack: **FastAPI + PostgreSQL**, in the same modular monolith the blueprint already specifies (clear routes / services / repositories — no microservices).

```
POST   /companies
GET    /companies
GET    /companies/{id}
PUT    /companies/{id}
DELETE /companies/{id}

POST   /companies/{id}/contacts
GET    /companies/{id}/contacts

POST   /companies/{id}/notes
GET    /companies/{id}/notes

POST   /companies/{id}/activities
GET    /companies/{id}/activities

POST   /companies/{id}/tasks
GET    /companies/{id}/tasks

PUT    /companies/{id}/stage
PUT    /companies/{id}/owner

GET    /crm/pipeline
GET    /crm/dashboard
GET    /crm/followups
GET    /crm/activities

GET    /crm/search
GET    /crm/filters
```

15 Frontend Pages

```
/login

/dashboard

/crm
    ├─ Companies
    ├─ Pipeline
    ├─ Tasks
    ├─ Activities
    └─ Contacts

/crm/companies/{id}
/crm/contacts/{id}
/crm/tasks
/crm/activities

/map

/admin/users
/admin/stages
/admin/settings
```

Company Page Layout (reference wireframe)

```
------------------------------------------------
ABC Industries

Industry: Chemicals       Stage: Qualified
Owner: Bhavya             Priority: High

[Call] [Email] [Add Note] [Add Task] [View Map]
------------------------------------------------

CONTACTS
Rahul Shah | Plant Manager | +91 XXXXXXXX

FACILITIES
• Surat Plant
• Vapi Warehouse

ACTIVITY
------------------------------------------------
23 Aug  Call
22 Aug  Note
20 Aug  Meeting
18 Aug  Stage changed
------------------------------------------------

NOTES
------------------------------------------------
Warehouse requirement discussed...
------------------------------------------------

NEXT FOLLOW-UP
25 Aug | Call Rahul | Bhavya
------------------------------------------------
```

16 Out of Scope (Phase 2+)

Do **not** ask the co-developer to build any of the following in this phase. The blueprint places these CRM integrations and expansions in later phases:

- Later WhatsApp integration
- Later Email automation
- Later Calling integration
- Later Marketing automation
- Later Advanced sales forecasting
- Later Full ERP integration
- Later Salesforce / HubSpot integration
- Later Complex workflow automation
- Later AI chatbot / AI agent
- Later AI lead scoring

17 Suggested Developer Split

If the co-developer owns the CRM module end-to-end, split the work like this:

Frontend

- CRM dashboard
- Company list
- Company detail
- Pipeline / Kanban
- Contacts
- Tasks
- Notes
- Activity timeline
- Filters / search
- User / owner assignment

Backend

- CRM database schema
- CRUD APIs
- Contacts
- Notes
- Activities
- Tasks
- Pipeline / stages
- Assignment
- Permissions
- Activity history / audit logs

Integration Points (shared responsibility)

- Company ↔ Facility
- Company ↔ Map
- Company ↔ CRM
- Authentication / RBAC

> This keeps the CRM cleanly separated from the AI/data-ingestion workstream, while still relying on the company/facility foundation of Fairway. The blueprint's two-developer model separates backend/data from frontend/map/UX and requires regular integration checkpoints rather than isolated silos.
